Still Having Problems With Your Connectors Coming Loose?

Safe-D-LOCK connectors offer a reliable alternative to conventional self-locking connectors, adhesive compounds or safety wire. The unique design installs quickly without wasting valuable mass or space in the host system.

Safe-D-LOCK locks to the D-FLAT on the mating connector. This provides a true lock that cannot be compromised when the cable is rotated.

Safe-D-LOCK technology is contained entirely in the coupling nut of the connector. This allows the feature to be easily ported into different implementations, including low-profile, right-angle connectors.

To insure proper mating and locking of Safe-D-LOCK, please make sure your mating connector meets these requirements:

- SMA Socket Interface Per MIL-STD-348
- 2.92mm and 3.5mm connector families
- ±.001 THD, Major Dia.
- .250-36 UNS-2A THD.
- Body Material: Steel OR BeCu
